Inertial Quasi-Velocity Based Controllers for a Class of Vehicles Przemyslaw Herman, 2022-02-26 This book offers a timely overview of nonlinear control methods applied to a set of vehicles and their applications to study vehicle dynamics The first part on the book presents the mathematical models used for describing motion of three class of vehicles such as underwater vehicles hovercrafts and airships In turn each model is expressed in terms of Inertial Quasi Velocities Various control strategies from the literature including model free ones are then analyzed The second part and core of the book guides readers to developing model based control algorithms using Inertial Quasi Velocities Both non adaptive and adaptive versions are covered Each controller is validated through simulation tests which are reported in detail In turn this part shows how to use the controllers to gain information about vehicle dynamics thus describing an important relationship between the dynamics of the moving object and its motion control The effects of mechanical couplings between variables describing vehicle motion due to inertial

forces are also discussed All in all this book offers a timely guide and extensive information on nonlinear control schemes for unmanned marine and aerial vehicles It covers specifically the simulation tests and is therefore meant as a starting point for engineers and researchers that would like to verify experimentally the suitability of the proposed models in real vehicles Further it also supports advanced level students and educators in their courses on vehicle dynamics control engineering and robotics
