An Unnatural History of Emerging Infections
 Ron Barrett, George Armelagos (the late), 2013-09-19
 This book traces the social and environmental determinants of human infectious diseases from the Neolithic to the present day. Despite recent high profile discoveries of new pathogens, the major determinants of these emerging infections are ancient and recurring. These include changing modes of subsistence, shifting populations, environmental disruptions, and social inequalities. The recent labeling of the term re-emerging infections reflects a re-emergence not so much of the diseases themselves but rather a re-emerging awareness in affluent societies of long standing problems that were previously ignored. *An Unnatural History of Emerging Infections* illustrates these recurring problems and determinants through an examination of three major epidemiological transitions. The First Transition occurred with the Agricultural Revolution, beginning 10,000 years ago, bringing a rise in acute infections as the main cause of human mortality. The Second Transition first began with the Industrial Revolution; it saw a decline in infectious disease mortality and an increase in chronic diseases among wealthier nations but less so in poorer societies. These culminated in today's worst of both worlds syndrome in which globalization has combined with the challenges of the First and Second Transitions to produce a Third Transition characterized by a confluence of acute and chronic disease patterns within a single global disease ecology. This accessible text is suitable for advanced undergraduate and graduate level students and researchers in the fields of epidemiology, disease ecology, anthropology, health sciences, and the history of medicine. It will also be of relevance and use to undergraduate students interested in the history and social dynamics of infectious diseases.

Clinical Pharmacology: Current Topics and Case Studies
 Markus Müller, 2011-02-04
 Today we witness an eventful time in which the powerful new forces of genomics, information technology, and economics are rapidly changing the science and art of medicine. This will require more specialization than ever before. However, there is also an increasing demand for an integrated approach which is provided by the discipline of Clinical Pharmacology (CP). CP pursues a scientific goal by studying drug action in patients and volunteers, a clinical goal by administering appropriate drug therapy, and a regulatory goal by assessing the risk/benefit ratio of drug candidates in drug development and reimbursement. This introduction to current topics of CP covers traditional topics of clinical drug research and trial methodology but also provides insight in current topics like genomics, imaging technology, and issues in drug reimbursement. A number of concrete case studies in clinical drug research and development help to give a better understanding of the general principles of CP.
