Mathematics Of Natural Catastrophes:

The Mathematics Of Natural Catastrophes Gordon Woo,1999-10-15 This is a unique book about natural catastrophes focusing on the mathematical aspects of these phenomena Although academic in style and didactic in purpose it is practical in the treatment of the diverse issues covered which range from hazard warning and forecasting to engineering design criteria and insurance loss estimation Addressing as it does many mathematical topics not found together in a single volume the book should be of value to all those with a quantitative educational interest in or professional concern for natural catastrophes

Risk and Uncertainty Assessment for Natural Hazards Jonathan Rougier, Steve Sparks, Lisa J. Hill, 2013-02-21 Assessment of risk and uncertainty is crucial for natural hazard risk management facilitating risk communication and informing strategies to successfully mitigate our society s vulnerability to natural disasters Written by some of the world s leading experts this book provides a state of the art overview of risk and uncertainty assessment in natural hazards It presents the core statistical concepts using clearly defined terminology applicable across all types of natural hazards and addresses the full range of sources of uncertainty the role of expert judgement and the practice of uncertainty elicitation The core of the book provides detailed coverage of all the main hazard types and concluding chapters address the wider societal context of risk management This is an invaluable compendium for academic researchers and professionals working in the fields of natural hazards science risk assessment and management and environmental science and will be of interest to anyone involved in natural hazards policy Extreme Natural Hazards, Disaster Risks and Societal Implications Alik Ismail-Zadeh, Jaime Urrutia Fucugauchi, Andrzej Kijko, Kuniyoshi Takeuchi, Ilya Zaliapin, 2014-04-17 This book presents a unique interdisciplinary approach to disaster risk research combining cutting edge natural science and social science methodologies Bringing together leading scientists policy makers and practitioners from around the world it presents the risks of global hazards such as volcanoes seismic events landslides hurricanes precipitation floods and space weather and provides real world hazard case studies from Latin America the Caribbean Africa the Middle East Asia and the Pacific region Avoiding complex mathematics the authors provide insight into topics such as the vulnerability of society disaster risk reduction policy relations between disaster policy and climate change adaptation to hazards and re insurance approaches to extreme events This is a key resource for academic

researchers and graduate students in a wide range of disciplines linked to hazard and risk studies including geophysics volcanology hydrology atmospheric science geomorphology oceanography and remote sensing and for professionals and policy makers working in disaster prevention and mitigation

Heavy-Tailed Distributions in Disaster Analysis V. Pisarenko, M. Rodkin, 2010-07-20 Mathematically natural disasters of all types are characterized by heavy tailed distributions The analysis of such distributions with common methods such as averages and dispersions can therefore lead to erroneous conclusions The statistical methods described in this book avoid such pitfalls Seismic disasters are studied primarily thanks to the availability of an ample statistical database New approaches are presented to seismic risk estimation and forecasting the damage caused by earthquakes ranging from typical moderate events to very rare extreme disasters Analysis of these latter events is based on the limit theorems of probability and the duality of the generalized Pareto distribution and generalized extreme value distribution It is shown that the parameter most widely used to estimate seismic risk $M_{\max}$ the maximum possible earthquake value is potentially non robust Robust analogues of this parameter are suggested and calculated for some seismic catalogues Trends in the costs inferred by damage from natural disasters as related to changing social and economic situations are examined for different regions The results obtained argue for sustainable development whereas entirely different incorrect conclusions can be drawn if the specific properties of the heavy tailed distribution and change in completeness of data on natural hazards are neglected This pioneering work is directed at risk assessment specialists in general seismologists administrators and all those interested in natural disasters and their impact on society
