F. Wilkinson,Jos B.T.M. Roerdink,2009-08-19 The 9th ISMM conference covered a very diverse collection of papers bound together by the central themes of mathematical

morphology namely the treatment of images in terms of set and lattice theory Notwithstanding this central theme this ISMM showed increasing interaction with other fields of image and signal processing and several hybrid methods were presented which combine the strengths of traditional morphological methods with those of for example linear filtering This trend is particularly strong in the emerging field of adaptive morphological filtering where the local shape of structuring elements is determined by non morphological techniques This builds on previous developments of PDE based methods in morphology and amoebas In segmentation we see similar advancements in the development of morphological active contours Even within morphology itself diversification is great and many new areas of research are being opened up In particular morphology of graph based and complex based image representations are being explored Likewise in the well established area of connected filtering we find new theory and new algorithms but also expansion into the direction of hyperconnected filters New advances in morphological machine learning multi valued and fuzzy morphology are also presented Notwithstanding the often highly theoretical reputation of mathematical morphology practitioners in this field have always had an eye for the practical

Signal and Image Processing in Navigational Systems Vyacheslav Tuzlukov, 2018-10-03 Classical and modern theories have given us a degree of noise immunity by defining the sufficient statistic of the mean of the likelihood function The generalized theory moves beyond these limitations to determine the jointly sufficient statistics of the mean and variance of the likelihood function Signal and Image Processing in Navigational Systems introduces us to the generalized approach and then delves rigorously into the theory and practical applications of this approach This volume represents the most in depth discussion of the generalized approach to date providing many examples and computer models to demonstrate how this approach raises the upper limits of noise immunity for navigation systems leading to better detection performances This book is vital for signal and image processing experts radar communications acoustics and navigational systems designers as well as professionals in the fields of statistical pattern recognition biomedicine astronomy and robotics who wish to extend the boundaries of noise immunity and improve qualitative performance of their systems
