process during canning destroys from one third to one half of vitamins A and C thiamin and riboflavin Once canned additional losses of these sensitive vitamins are from 5 to 20 percent each year The amounts of other vitamins however are only slightly lower in canned compared with fresh food If vegetables are handled properly and canned promptly after harvest they can be more nutritious than fresh produce sold in local stores The advantages of home canning are lost when you start with poor quality fresh foods when jars fail to seal properly when food spoils and when flavors texture color and nutrients deteriorate during prolonged storage The information and guides that follow explain many of these problems and recommend ways to minimize them The high percentage of water in most fresh foods makes them very perishable They spoil or lose their quality for several reasons growth of undesirable microorganisms bacteria molds and yeasts activity of food enzymes reactions with oxygen moisture loss Microorganisms live and multiply quickly on the surfaces of fresh food and on the inside of bruised insect damaged and diseased food Oxygen and enzymes are present throughout fresh food tissues Proper canning practices include carefully selecting and washing fresh food peeling some fresh foods hot packing many foods adding acids lemon juice or vinegar to some foods using acceptable jars and self sealing lids processing jars in a boiling water or pressure canner for the correct period of time Collectively these practices remove oxygen destroy enzymes prevent the growth of undesirable bacteria yeasts and molds and help form a high vacuum in jars Good vacuums form tight seals which keep liquid in and air and microorganisms out
