Approximate and Noisy Realization of Discrete-Time Systems and Digital Images Yasumichi Hasegawa, 2009-09-30

This monograph deals with approximation and noise cancellation of dynamical systems which include linear and nonlinear input output relationships It also deal with approximation and noise cancellation of two dimensional arrays It will be of special interest to researchers engineers and graduate students who have specialized in filtering theory and system theory and digital images This monograph is composed of two parts Part I and Part II will deal with approximation and noise cancellation of dynamical systems or digital images respectively From noiseless or noisy data reduction will be made A method which reduces model information or noise was proposed in the reference vol 376 in LNCIS Hasegawa 2008 Using this method will allow model description to be treated as noise reduction or model reduction without having to bother for example with solving many partial differential equations This monograph will propose a new and easy method which produces the same results as the method treated in the reference As proof of its advantageous effect this monograph provides a new law in the sense of numerical experiments The new and easy method is executed using the algebraic calculations without solving partial differential equations For our purpose many actual examples of model information and noise reduction will also be provided Using the analysis of state space approach the model reduction problem may have become a major theme of technology after 1966 for emphasizing efficiency in the fields of control economy numerical analysis and others **Multivariable Control** S.G.

Tzafestas, 2012-12-06 The foundation of linear systems theory goes back to Newton and has been followed over the years by many improvements such as linear operator theory Laplace Transformation etc After the World War II feedback control theory has shown a rapid development and standard elegant analysis and synthesis techniques have been discovered by control system workers such as root locus Evans and frequency response methods Nyquist Bode These permitted a fast and efficient analysis of simple loop control systems but in their original paper and pencil form were not appropriate for multiple loop high order systems The advent of fast digital computers together with the development of multivariable multi loop system techniques have eliminated these difficulties Multivariable control theory has followed two main avenues the optimal control approach and the algebraic and frequency domain control approach An important key concept in the whole multivariable system theory is observability and controllability which revealed the exact relationships between transfer functions and the state variable representations This has given new insight into the phenomenon of hidden oscillations and to the transfer function modelling of dynamic systems The basic tool in optimal control theory is the celebrated matrix Riccati differential equation which provides the time varying feedback gains in a linear quadratic control system cell Much theory

presently exists for the characteristic properties and solution of this Riccati equation Advanced Intelligent Computing De-Shuang Huang, Yong Gan, Vitoantonio Bevilacqua, Juan Carlos Figueroa, 2012-02-10 This book constitutes the thoroughly refereed post conference proceedings of the 7th International Conference on Intelligent Computing ICIC 2011 held in Zhengzhou China in August 2011 The 94 revised full papers presented were carefully reviewed and selected from 832 submissions The papers are organized in topical sections on neural networks machine learning theory and methods fuzzy theory and models fuzzy systems and soft computing evolutionary learning swarm intelligence and optimization intelligent computing in computer vision intelligent computing in image processing biometrics with applications to individual security forensic sciences intelligent image document retrievals natural language processing and computational linguistics intelligent data fusion and information security intelligent computing in pattern recognition intelligent agent and web applications intelligent computing in scheduling intelligent control and automation **Proceedings of the 3rd International Conference on Frontiers of Intelligent Computing: Theory and Applications (FICTA) 2014** Suresh Chandra Satapathy, Bhabendra Narayan Biswal, Siba K. Udgata, J.K. Allidina, B.K. Daniels, 2013-11-21 This volume provides the proceedings of the First European Workshop on Parallel Processing Techniques for Simulation which was held at the end of October 1985 The Workshop was organized within the framework of a joint project sponsored by the Commission of the European Communities under the research part of the multiannual programme in the field of Data Processing aiming at promoting collaborative research work in the Community The project involved collaborative work between the Complex Systems Group of the Control Systems Centre at UMIST the Systems Reliability Service of the United Kingdom Atomic Energy Authority and the University of Bergamo Italy The aim of this project was to develop decomposition coordination techniques which would be of help in the simulation of complex dynamical systems on parallel processing facilities One of the major aims of the Workshop was to report on the results produced within the project and to try to relate these to the leading work going on in this field in other centres of excellence With this in mind the Proceedings Volume is split up into a number of parts corresponding to the main sessions within the Workshop programme *Hyperspectral Data Processing* Chein-I Chang, 2013-02-01 Hyperspectral Data Processing Algorithm Design and Analysis is a culmination of the research conducted in the Remote Sensing Signal and Image Processing Laboratory RSSIPL at the University of Maryland Baltimore County Specifically it treats hyperspectral image processing and hyperspectral signal processing as separate subjects in two different categories Most materials

covered in this book can be used in conjunction with the author's first book *Hyperspectral Imaging Techniques for Spectral Detection and Classification* without much overlap. Many results in this book are either new or have not been explored, presented or published in the public domain. These include various aspects of endmember extraction, unsupervised linear spectral mixture analysis, hyperspectral information compression, hyperspectral signal coding and characterization, as well as applications to conceal target detection, multispectral imaging and magnetic resonance imaging. *Hyperspectral Data Processing* contains eight major sections. Part I provides fundamentals of hyperspectral data processing. Part II offers various algorithm designs for endmember extraction. Part III derives theory for supervised linear spectral mixture analysis. Part IV designs unsupervised methods for hyperspectral image analysis. Part V explores new concepts on hyperspectral information compression. Parts VI-VII develop techniques for hyperspectral signal coding and characterization. Part VIII presents applications in multispectral imaging and magnetic resonance imaging. *Hyperspectral Data Processing* compiles an algorithm compendium with MATLAB codes in an appendix to help readers implement many important algorithms developed in this book and write their own program codes without relying on software packages. *Hyperspectral Data Processing* is a valuable reference for those who have been involved with hyperspectral imaging and its techniques, as well as those who are new to the subject.
