

because the data are so urgently needed for abundance determinations and for comparisons with other stellar spectra.

The range of the present table has been limited to that long span of the solar spectrum that overlaps the more recent and current observations from rocket and orbiting-solar-observatory spectra in the ultraviolet (short of 3000 Å), and from the Fraunhofer spectra in the infrared (long of 7500 Å). It is essentially a second revision of Rowland's Table corrected and supplemented by the Utrecht Atlas material. Even in this range the work is far from completed. Many more solar lines

will doubtless be added when the spectrum has been completely reobserved under the best observing conditions and with the best available modern instruments. The task of remeasuring the complex spectrum and of extending identifications and intensity measurements is a heavy one in itself, and one that requires, also, much additional work on the analysis of individual laboratory spectra. The present contribution is intended as a convenient handbook for the astrophysicist until the ideal self-contained compendium of the solar spectrum from the x-ray to the microwave region becomes a reality.

2. Description of the Solar Spectrum Compendium

The successive columns of the solar ledger are described. The general procedure by which the data on measured intensities have been obtained is fully explained. The many users require, also, more detailed information on the analyses of individual spectra than can be recorded here, for the many lines classified from laboratory investigations. Sufficient information is given in the ledger to provide convenient cross reference to the separate papers on spectrum analysis. For special details concerning individual lines the column headed "Notes" should be consulted.

2.1 The Wavelengths: Column One

A comprehensive revision of Rowland's *Preliminary Table of Solar Spectrum Wavelengths* entails a thorough study of the wavelengths of the lines reported by Rowland. These remarkably accurate measurements by Jewell, that date back to 1895-97 [2], were reduced to the International Scale of Wavelengths in the first revision of Rowland's Table in 1928 [3].

The tremendous amount of work that has gone into interferometric observations for precise wavelength standards need not be discussed here. Details may be found in the early Transactions of the International Astronomical Union [7], in the Allegheny Publications by Burns, Meggers, and Kloss [8], and in the Mount Wilson Contributions by St. John, H. D. Babcock and others. St. John discussed the method used for the reduction to the international system, and has published the correction curve based on the International Standard Wavelength Scale of 1922 [3]. The wavelengths listed in the 1928 edition are based on this curve. They are in three categories: (1) Lines marked "m". These lines were observed by Rowland, but remeasured for use in correcting Rowland's wavelength scale. (2) Lines marked "w", denoting weighted means of remeasured lines and Rowland's corrected values. (3) Undesignated wavelengths; these formed the great majority. They were lines listed by Rowland but corrected to the international scale of 1922 by means of the correction curve adopted in 1928.

Throughout the years in which the 1928 edition has been actively used, several problems regarding wavelengths have arisen. Further work on the International Standards has indicated that a small running correction is required to reduce the wavelengths based on the 1922 scale to the scale adopted in 1928 by the International Astronomical Union. These corrections, reported by H. D. Babcock [9] are as follows:

Table 1. Wavelength Corrections for Reduction to the 1928 Scale of Standards

Region (Å)	Correction to 1922 Scale (Å)	Region (Å)	Correction to 1922 Scale (Å)
2995-3133	-0.0012	6125-6200	-0.006

* Values in parentheses are interpolated.

They must be applied to all wavelengths published in the 1928 edition, in order to comply with the standards recommended by Commission 14 of the Union.

Although Rowland's observations extend from 2975 Å to 7330 Å, his spectrograms did not record the solar spectrum completely in the ranges short of 3000 Å and long of 6600 Å. With the development of new photographic emulsions, Rowland's work has been superseded in the short- and long-wave regions. Meggers made a thorough study of the spectrum from 6500 Å to 9000 Å in 1919 [10] and by means of Doppler displacements, carefully separated the solar lines from the telluric lines. This work was subsequently extended at Mount Wilson by H. D. Babcock and others, by comparing line intensities at high and low sun. In the present table the
