Nephrotoxic Mechanisms of Drugs and Environmental Toxins George A. Porter,2013-11-21 The majority of the offending toxicants to be reviewed in this volume were developed to help mankind and it is only with prolonged or widespread application that their adverse effects have been recognized Conversely in the case of prescription drugs there has been an attempt to identify the adverse effects in advance and incorporate these risks into the decision of approval for human consumption Unfortunately for those drugs in which recognized injury occurs only after prolonged use such appraisals are made in retrospect Despite this most renal injury induced by drugs or toxicants can be either prevented by excluding drugs with unacceptable side effects or interrupted by eliminating the offending agent once damage is manifested The fact that prevention reversibility or arrest of renal injury is possible provided a major impetus for this publication Since no international registry for nephrotoxic injury exists estimates of incidence must rely on less than ideal sources Recently I together with Dr William Bennett summarized a survey of the frequency of various categories of nephrologic disease Porter and Bennett 1981 Based on this survey we projected that in nearly one of ten patients seeking nephrologic consultation a nephrotoxic etiology may be involved Of cases of end stage renal disease between 3 and 4% are due to drug nephrotoxicity according to recent published results European Dialysis and Transplant Association 1979 For acute renal failure antibiotics

and contrast agents persist as major offending agents while for chronic renal failure analgesics remain a worldwide problem
