*Fundamentals of Electronic Imaging Systems* William F. Schreiber, 2012-12-06 Image processing is a fascinating applications area not a fundamental science of sufficient generality to warrant studying it for its own sake In this area there are many opportunities to apply art and experience as well as knowledge from a number of sciences and engineering disciplines to the creation of products and processes for which society has an expressed need Without this need work in the field would be sterile but with it image processing can readily provide the interested scientist or engineer with a professional lifetime of challenging problems and corresponding rewards This point of view motivates this book and has influenced the selection and treatment of topics I have not attempted to 1 be encyclopedic this service has already been performed by others It will be noted that the word digital is not in the title of this book While much of present day image processing is implemented digitally this work is not intended for those who think of image processing as a branch of digital signal processing except perhaps to try to change their minds Image gathering and image display vital parts of the field with strong effects on image quality are inherently analog as is image transmission in today s most important medium the over the air broadcasting channel The latter is not about to die as it is by far the cheapest way to deliver broadband signals to the home Likewise the principal means of recording images on paper are continuous and not discrete

**Monographic Series** Library of Congress, **Robot sensors and transducers** S Ruocco, 2013-06-29 The use of sensor s with machines whether to control them continuously or to inspect and

verify their operation can be highly cost effective in particular areas of industrial automation Examples of such areas include sensing systems to monitor tool condition force and torque sensing for robot assembly systems vision based automatic inspection and tracking sensor s for robot arc welding and seam sealing Many think these will be the basis of an important future industry So far design of sensor systems to meet these needs has been in the interest of cheapness rather ad hoc and carefully tailored to the application both as to the transducer hardware and the associated processing software There are now however encouraging signs of commonality emerging between different sensor application areas For instance many commercial vision systems and some tactile systems just emerging from research are able to use more or less standardized techniques for two dimensional image processing and shape representation Structured light triangulation systems can be applied with relatively minor hardware and software variations to measure three dimensional profiles of objects as diverse as individual soldered joints body pressings and weldments Sensors make it possible for machines to recover sensibly from errors and standard software procedures such as expert systems can now be applied to facilitate this
