Loss and Restoration of Regenerative Capacity in Tissues and Organs of Animals Lev Vladimirovich Polezhaev, 1972 This well illustrated monograph is the first summary in English of L V Polezhaev s important but lesser known work on the regenerative phenomena in mammalian forms conducted since World War II During this period Soviet research underwent a pronounced shift in emphasis from basic biological studies based primarily upon amphibians to more practically oriented problems in mammalian systems Polezhaev s experimentation underwent a corresponding shift but the focus on restoration of lost regenerative capacity was retained since his earlier work which is also reviewed here on limb regeneration in frogs Following a theoretical discussion the monograph centers upon the author s most profound innovations a successful method for producing bone to heal large skull defects original research on heart regeneration and trials in the restoration of limb regeneration following X irradiation Organ Regeneration L. D. Liozner, 2013-03-09 The main theme of this monograph conditions of regeneration of organs in mammals reflects an area of increasing emphasis which permeates much current Soviet research on regeneration The introduction of this theme goes back about 25 years and emphasis on the influence of environmental conditions upon regenerative processes has fluctuated until the mid 1960s when the viewpoints on this subject were established in much the same form as they are expressed in this book For years Russian regeneration research has been characterized by the presence of several dominant and often conflicting schools of thought Since an acquaintance with these makes the interpretation of many of the theoretical implications of this book particularly in the introductory and concluding chapters considerably clearer those not familiar with the Russian literature might profit by reading my brief survey of this field Carlson B M 1968 Regeneration research in the Soviet Union Anat Rec 160 665 674 **Regenerative Medicine I** Ioannis V. Choi, Besim Ben-Nissan, 2022-01-01 This book is part of a two part volume book that highlights the latest advances in innovative bioceramics applied in the highly interdisciplinary area referred to as translational medicine This volume covers the basic principles and techniques used in the manufacture of bioceramics and biocomposites for various biomedical applications including drug delivery implantable bionics and the development of the cardiac pacemaker and bone tissue engineering Furthermore self healing materials have been attracting increasing interest in both engineering and medical applications during the past two decades Self healing hydrogels are particularly interesting

because of their ability to repair structural damages and recover their original functions specifically in tissue engineering

Heart Development and Regeneration Nadia Rosenthal, Richard P. Harvey, 2010-05-28 The development of the cardiovascular system is a rapidly advancing area in biomedical research now coupled with the burgeoning field of cardiac regenerative medicine A lucid understanding of these fields is paramount to reducing human cardiovascular diseases of both fetal and adult origin Significant progress can now be made through a comprehensive investigation of embryonic development and its genetic control circuitry *Heart Development and Regeneration* written by experts in the field provides essential information on topics ranging from the evolution and lineage origins of the developing cardiovascular system to cardiac regenerative medicine A reference for clinicians medical researchers students and teachers this publication offers broad coverage of the most recent advances Volume One discusses heart evolution contributing cell lineages model systems cardiac growth morphology and asymmetry heart patterning epicardial vascular and lymphatic development and congenital heart diseases Volume Two includes chapters on transcription factors and transcriptional control circuits in cardiac development and disease epigenetic modifiers including microRNAs genome wide mutagenesis imaging and proteomics approaches and the theory and practice of stem cells and cardiac regeneration Authored by world experts in heart development and disease New research on epigenetic modifiers in cardiac development Comprehensive coverage of stem cells and prospects for cardiac regeneration Up to date research on transcriptional and proteomic circuits in cardiac disease Full color detailed illustrations

Regenerative Medicine Applications in Organ Transplantation Giuseppe Orlando, 2013-10-11 *Regenerative Medicine Applications in Organ Transplantation* illustrates exactly how these two fields are coming together and can benefit one another It discusses technologies being developed methods being implemented and which of these are the most promising The text encompasses tissue engineering biomaterial sciences stem cell biology and developmental biology all from a transplant perspective Organ systems considered include liver renal intestinal pancreatic and more Leaders from both fields have contributed chapters clearly illustrating that regenerative medicine and solid organ transplantation speak the same language and that both aim for similar medical outcomes The overall theme of the book is to provide insight into the synergy between organ transplantation and regenerative medicine Recent groundbreaking achievements in regenerative medicine have received unprecedented coverage by the media fueling interest and enthusiasm in transplant clinicians and researchers Regenerative medicine is changing the premise of solid organ transplantation requiring transplantation investigators to become familiar with regenerative medicine investigations that can be extremely relevant to their work Similarly regenerative medicine investigators need to be aware of the needs of the transplant field to bring these two fields together for greater results Bridges the gap between regenerative medicine and solid organ transplantation and highlights reasons for collaboration Explains the importance and future potential of regenerative medicine to the transplant community Illustrates to regenerative medicine investigators the needs of the transplant discipline

Methods in Mammalian Reproduction Joseph C. Jr. Daniel, 2012-12-02 Methods in Mammalian Reproduction presents some of the techniques for manipulating analyzing observing testing and generally experimenting with mammalian mothers and their gametes and embryos Mammalian reproduction involves an intimate relationship between mother and embryo The first 18 chapters are arranged in an order that follows a developmental sequence from oocyte to fetal organs and the remaining seven chapters deal with the maternal side of the relationship With strong focus on laboratory rodents and lagomorphs the book starts with an introduction to in vitro oocyte maturation and experimental production of mammalian parthenogenetic It goes on to describe the microtechniques in pre implantation of embryos production of chimeras techniques for early embryonic tissue separation mammalian embryo preservation by freezing and in vitro development of whole mouse embryos beyond the implantation stage Chapters 11 15 discuss the in vitro implantation of mouse blastocysts advances in rabbit embryo and in large mammal embryo cultures embryo transfer in large domestic mammals and manipulation of marsupial embryos and pouch young The following chapters cover reproduction experiments using marsupials domestic farm species and primates including humans Finally the concluding chapters tackle the use of amniocentesis in prenatal diagnosis collection and analysis of female genital tract secretions analysis of antifertility action of intrauterine devices and surgical induction of endometriosis This book will be helpful to students teachers researchers and clinical researchers who demand for more and better procedures for analysis of mammalian reproduction

Understanding Innovation Through Exaptation Caterina AM La Porta, Stefano Zapperi, Luciano Pilotti, 2020-07-09 This book explores the role of exaptation in diverse areas of life with examples ranging from biology to economics social sciences and architecture The concept of exaptation introduced in evolutionary biology by Gould and Vrba in 1982 describes the

possibility that already existing traits can be exploited for new purposes throughout the evolutionary process Edited by three active scholars in the fields of biology physics and economics the book presents an interdisciplinary collection of expert viewpoints illustrating the importance of exaptation for interpreting current reality in various fields of investigation Using the lenses of exaptation the contributing authors show how to view the overall macroscopic landscape as comprising many disciplines all working in unity within a single complex system This book is the first to discuss exaptation in both hard and soft disciplines and highlights the role of this concept in understanding the birth of innovation by identifying key elements and ideas It also offers a comprehensive guide to the emerging interdisciplinary field of exaptation provides didactic explanations of the basic concepts and avoids excessive jargon and heavy formalism Its target audience includes graduate students in physics biology mathematics economics psychology and architecture it will also appeal to established researchers in the humanities who wish to explore or enter this new science driven interdisciplinary field **Cumulated Index**
