Reversing Christian Mancas, 2018-04 , **If...Then** Taina Bucher, 2018-06-05 We live in a world in which Google's search algorithms determine how we access information Facebook's News Feed algorithms shape how we socialize and Netflix collaborative filtering algorithms choose the media products we consume As such we live algorithmic lives Life however is not blindly controlled or determined by algorithms Nor are we simply victims of an ever expanding artificial intelligence Rather than looking at how technologies shape or are shaped by political institutions this book is concerned with the ways in which informational infrastructure may be considered political in its capacity to shape social and cultural life It looks specifically at the conditions of algorithmic life how algorithms work both materially and discursively to create the conditions for sociality and connectivity The book argues that the most important aspect of algorithms is not what they are in terms of their specific technical details but rather how they become part of social practices and how different people enlist them as powerful brokers of information communication and society If we truly want to engage with the promises of automation and predictive analytics entailed by the promises of big data we also need to understand the contours of algorithmic life that condition such practices Setting out to explore both the specific uses of algorithms and the cultural forms they generate this book offers a novel understanding of the power and politics of algorithmic life as grounded in case studies that explore the material discursive dimensions of software

Floridi,2013-01-10 Luciano Floridi presents a book that will set the agenda for the philosophy of information PI is the philosophical field concerned with 1 the critical investigation of the conceptual nature and basic principles of information including its dynamics utilisation and sciences and 2 the elaboration and application of information theoretic and computational methodologies to philosophical problems This book lays down for the first time the conceptual foundations for this new area of research It does so systematically by pursuing three goals Its metatheoretical goal is to describe what the philosophy of information is its problems approaches and methods Its introductory goal is to help the reader to gain a better grasp of the complex and multifarious nature of the various concepts and phenomena related to information Its analytic goal is to answer several key theoretical questions of great philosophical interest arising from the investigation of semantic information Official (ISC)2 Guide to the CSSLP CBK Mano Paul,2013-08-20 Application vulnerabilities continue to top the list of cyber security concerns While attackers and researchers continue to expose new application vulnerabilities the most common application flaws are previous rediscovered threats The text allows readers to learn about software security from a renowned security practitioner who is the appointed software assurance advisor for ISC 2 Complete with numerous illustrations it makes complex security concepts easy to understand and implement In addition to being a valuable resource for those studying for the CSSLP examination this book is also an indispensable software security reference for those already part of the certified elite A robust and comprehensive appendix makes this book a time saving resource for anyone involved in secure software development **Virtual Teacher** Boris Aberšek,Janez Bregant,2014-10-17 Today in the age of technology contemporary researchers from the fields of philosophy cognitive science neurobiology and artificial intelligence ask many questions about the nature of the mind and body originating in ancient Greek philosophy Among those are also questions about the relationship between humans and machines and the implications this carries for solving traditional problems within philosophy In this book the term machine is taken to refer to every system which in the contemporary world tries to make a task easier for humans or even tries to replace the human altogether such as a humanoid robot able to perform different physical activities as well as various mental activities like decision making and problem solving The volume makes the first step towards a connection between certain different disciplines involved in education The gap between neurochemistry cognitive science neurobiology and other rapidly developing disciplines on one side and education as part of social sciences on the other currently appears to be great and even unbridgeable except by analogy metonymy and metaphor From the experiences of recent years it seems clear that the existing educational system as a whole is perceived as an ailing system that fails to meet the needs of a major portion of the society it serves This book brings to attention a form of learning that transcends logic and rhetorical appeal It defines appropriate architecture on the basis of cognitive science and methods of artificial intelligence taking into account that a school system is a dynamical system which follows the dynamical systems theory The volume shows how to build an intelligent tutoring system and an intelligent teaching learning system upon it

Through the use of intelligent tutoring systems students are placed in an active role as opposed to the passive role that they more or less have today
