## Low Dimensional Sigma Models:

*Low-dimensional Sigma Models*, W. J. Zakrzewski, 1989-06 This book gathers together established ideas and applications of sigma models and presents them together with modern applications to provide a unified and complete view of simple sigma models and the role they play in model building in field theoretical methods in elementary particle physics The book is written for both mathematicians and physicists and is aimed at graduate students and researchers in theoretical particle physics who are interested in sigma models and those working in the general area of harmonic maps in pure mathematics

*Solitons in Low-dimensional Sigma Models* Jens Gladikowski, 1997      **Low Dimensional Sigma Models**, 1988 We discuss classical solutions of U N sigma models in two dimensions We show how from these solutions we can construct solutions of the U N sigma model with the Wess Zumino term with an arbitrary coefficient We discuss briefly various properties of these solutions Next we consider the O 3 sigma model in 2 1 dimensions and describe the preliminary results of some numerical work in which we studied the time evolution of some of the previously discussed two dimensional structures instantons and anti instantons under suitable assumptions about their initial values 9 refs 6 figs      **Quantum Non-linear**

**Sigma-Models** Sergei V. Ketov, 2000-09-14 Offers a systematic presentation of the modern quantum field theory of non linear sigma models These models are very popular in theoretical high energy physics string theory and statistical physics The geometric and quantum renormalization properties of the most general non linear sigma models are considered in detail within the framework of quantum perturbation theory The main applications to be considered in the book can be found in string theory conformal field theory and general relativity      *Low-Dimensional Applications of Quantum Field Theory* L.

Baulieu, Vladimir Kazakov, Marco Picco, Paul Windey, 2013-12-01 The Cargèse Summer School Low Dimensional Applications of Quantum Field Theory was held in July 1995 The School was dedicated to the memory of Claude Itzykson This session focused on the recent progress in quantum field theory in two dimensions with a particular emphasis on integrable models and applications of quantum field theory to condensed matter physics A large fraction of the school was also devoted to a detailed review of the exciting developments in four dimensional super symmetric Yang Mills theory The diversity of the topics presented constitute in our opinion one of the most attractive features of these proceedings Some contributions constitute a very thorough introduction to their subject matter and should be helpful to advanced students in the field while others present entirely new research not previously published and should be of considerable interest to the specialist There were in depth introductory lectures on the application of conformal field theory techniques to disordered systems on the quantum Hall effect on quantum integrable systems on the thermodynamic Bethe Ansatz and on the new developments in supersymmetric gauge theories The computation of the three point function of the Liouville model using conformal bootstrap methods was presented in detail      Exact Methods in Low-dimensional Statistical Physics and Quantum

**Tensor Network States and Effective Particles for Low-Dimensional Quantum Spin Systems** Laurens Vanderstraeten, 2017-08-10 This thesis develops new techniques for simulating the low energy behaviour of quantum spin systems in one and two dimensions Combining these developments it subsequently uses the formalism of tensor network states to derive an effective particle description for one and two dimensional spin systems that exhibit strong quantum correlations These techniques arise from the combination of two themes in many particle physics i the concept of quasiparticles as the effective low energy degrees of freedom in a condensed matter system and ii entanglement as the characteristic feature for describing quantum phases of matter Whereas the former gave rise to the use of effective field theories for understanding many particle systems the latter led to the development of tensor network states as a description of the entanglement distribution in quantum low energy states

**Field Theories for Low-Dimensional Condensed Matter Systems** Giuseppe Morandi, Pasquale Sodano, Arturo Tagliacozzo, Valerio Tognetti, 2013-03-14 This book is especially addressed to young researchers in theoretical physics with a basic background in Field Theory and Condensed Matter Physics The topics were chosen so as to offer the largest possible overlap between the two expertises selecting a few key problems in Condensed Matter Theory which have been recently revisited within a field theoretic approach The presentation of the material is aimed not only at providing the reader with an overview of this exciting frontier area of modern theoretical physics but also at elucidating most of the tools needed for a technical comprehension of the many papers appearing in current issues of physics journals and hopefully to enable the reader to tackle research problems in this area of physics This makes the material a live creature while not pretending it to be exhaustive it is tutorial enough to be useful to young researchers as a starting point in anyone of the topics covered in the book

**Scientific and Technical Aerospace Reports**, 1990 *Applications of Analytic and Geometric Methods to Nonlinear Differential Equations* P.A. Clarkson, 2012-12-06 In the study of integrable systems two different approaches in particular have attracted considerable attention during the past twenty years 1 The inverse scattering transform IST using complex function theory which has been employed to solve many physically significant equations the soliton equations 2 Twistor theory using differential geometry which has been used to solve the self dual Yang Mills SDYM equations a four dimensional system having important applications in mathematical physics Both soliton and the SDYM equations have rich algebraic structures which have been extensively studied Recently it has been conjectured that in some sense all soliton equations arise as special cases of the SDYM equations subsequently many have been discovered as either exact or asymptotic reductions of the SDYM equations Consequently what seems to be emerging is that a natural physically

significant system such as the SDYM equations provides the basis for a unifying framework underlying this class of integrable systems i.e. soliton systems. This book contains several articles on the reduction of the SDYM equations to soliton equations and the relationship between the IST and twistor methods. The majority of nonlinear evolution equations are nonintegrable and so asymptotic numerical perturbation and reduction techniques are often used to study such equations. This book also contains articles on perturbed soliton equations, Painlevé analysis of partial differential equations, studies of the Painlevé equations and symmetry reductions of nonlinear partial differential equations.

**ABSTRACT** In the study of integrable systems two different approaches in particular have attracted considerable attention during the past twenty years: the inverse scattering transform (IST) for soliton equations and twistor theory for the self-dual Yang-Mills (SDYM) equations. This book contains several articles on the reduction of the SDYM equations to soliton equations and the relationship between the IST and twistor methods. Additionally, it contains articles on perturbed soliton equations, Painlevé analysis of partial differential equations, studies of the Painlevé equations and symmetry reductions of nonlinear partial differential equations.

*Topology of Gauge Fields and Condensed Matter* M. Monastyrsky, 2013-06-29. Intended mainly for physicists and mathematicians, its high quality will definitely attract a wider audience. Computational Mathematics and Mathematical Physics. This work acquaints the physicist with the mathematical principles of algebraic topology, group theory and differential geometry as applicable to research in field theory and the theory of condensed matter. Emphasis is placed on the topological structure of monopoles and instantons, solutions to the Yang-Mills equations, the description of phases in superfluid  $^3\text{He}$  and the topology of singular solutions in  $^3\text{He}$  and liquid crystals.

**Backlund and Darboux Transformations** A. A. Coley, 2001. This book is devoted to a classical topic that has undergone rapid and fruitful development over the past 25 years, namely Backlund and Darboux transformations and their applications in the theory of integrable systems, also known as soliton theory. The book consists of two parts. The first is a series of introductory pedagogical lectures presented by leading experts in the field. They are devoted respectively to Backlund transformations of Painlevé equations, the dressing method and Backlund and Darboux transformations and to the classical geometry of Backlund transformations and their applications to soliton theory. The second part contains original contributions that represent new developments in the theory and applications of these transformations. Both the introductory lectures and the original talks were presented at an International Workshop that took place in Halifax, Nova Scotia, Canada. This volume covers virtually all recent developments in the theory and applications of Backlund and Darboux transformations.

**The Multifaceted Skyrmion** Mannque Rho, Ismail Zahed, 2016-09-29. This book presents in the form of reviews by the world's leading physicists in wide-ranging fields in theoretical physics the influence and prescience of Skyrme's daring idea of 1960, originally conceived for nuclear physics, that fermions can arise from bosons via topological solitons, pervasively playing a powerful role in wide-ranging areas of physics from nuclear astrophysics to particle physics to string theory and to condensed matter physics. The skyrmion description, both from gauge theory and from gauge

gravity duality offers solutions to some long standing and extremely difficult problems at high baryonic density inaccessible by QCD proper It also offers explanations and makes startling predictions for fascinating new phenomena in condensed matter systems In both cases what is at the core is the topology although the phenomena are drastically different even involving different spacetime dimensions This second edition has been expanded with addition of new reviews and extensively updated to take into account the latest developments in the field Contents Hadrons and Nuclear Matter Skyrmions and Nuclei R A Battye N S Manton and P M Sutcliffe States of Carbon 12 in the Skyrme Model P H C Lau and N S Manton Electromagnetic Form Factors of the Nucleon in Chiral Soliton Models G Holzwarth Exotic Baryon Resonances in the Skyrme Model D Diakonov and V Petrov Heavy Quark Skyrmions N N Scoccola Pentaquark Candidates P c 4380 and P c 4450 within the Soliton Picture of Baryons N N Scoccola D O Riska and M Rho Skyrmin Approach to Finite Density and Temperature B Y Park and V Vento Fractionized Skyrmions in Dense Compact Star Matter M Harada Y L Ma H K Lee and M Rho The Skyrme Model in the BPS Limit C Adam C Naya J S nchez Guill n R Vazquez and A Wereszczy ski Superqualitons Baryons in Dense QCD D K Hong Condensed Matter Rotational Symmetry Breaking in Baby Skyrme Models M Karliner and I Hen Emergent Gauge Fields and Their Nonperturbative Effects in Correlated Electrons K S Kim and A Tanaka Spin and Isospin Exotic Order in Quantum Hall Ferromanets S M Girvin Noncommutative Skyrmions in Quantum Hall Systems Z F Ezawa and G Tsitsishvili Meron Pair Excitations in Bilayer Quantum Hall System K Moon Spin and Pseudospin Textures in Quantum Hall Systems H A Fertig and L Brey Half Skyrmin Theory for High Temperature Superconductivity T Morinari Deconfined Quantum Critical Points T Senthil A Vishwanath L Balents S Sachdev and M P A Fisher Skyrmions in a Density Wave State A Mechanism for Chiral Superconductivity S Chakravarty and C H Hsu String Theory Skyrmin and String Theory S Sugimoto Holographic Baryons P Yi The Cheshire Cat Principle from Holography H B Nielsen and I Zahed Baryon Physics in a Five Dimensional Model of Hadrons A Pomarol and A Wulzer Holographic Skyrmions P M Sutcliffe Holographic Baryons and Instanton Crystal V Kaplunovsky D Melnikov and J Sonnenschein Readership Research scientists in the fields of condensed matter physics nuclear and particle physics and string theory
