Ultrastructure Techniques for Microorganisms H.C. Aldrich, W.J. Todd, 2012-12-06 The modern microbiologist is often a real specialist who has difficulty understanding and applying many of the techniques beyond those in his or her own immediate field On the other hand most benefits to modern microbiology are obtained when a broad spectrum of scientific approaches can be focused on a problem In early studies electron microscopy was pivotal in understanding bacterial and viral morphology and we still feel that we will understand a disease better if we have seen an electron micrograph of the causative agent Today because there is an increased awareness of the need to understand the relationships between microbial structure and function the electron microscope is still one of the most important tools microbiologists can use for detailed analysis of microorganisms Often however the aforementioned modern microbiologist still thinks of ultrastructure as involving negative staining or ultrathin sectioning in order to get a look at the shape of a bug Many of the newer ultrastructure techniques such as gold labeled antibody localization freeze fracture X ray microanalysis enzyme localization and even scanning electron microscopy are poorly understood by and therefore forbidding to the average microbiologist Even many cell biologists admit to having difficulty staying in touch with current developments in the fast moving field of electron microscopy techniques
