 contributions from leading authorities Informs and updates on all the latest developments in the field **Biochemicals and
 Reagents , Biophysical Approaches** Edward D. Korn,2013-04-17 The short period since the publication of Volume 1 of
 Methods in Membrane Biology has been a time of momentous progress Calorimetry electron spin and nuclear magnetic
 resonance X ray diffraction and freeze cleavage electron microscopy reinforced by biochemical analyses and enzymatic
 studies have led to universal acceptance of a generalized membrane model All membrane biologists would agree that a major
 element of all biological membranes is a bilayer of phospholipids which in some instances also contains other lipids notably
 sterols and glycolipids The fatty acid composition of the lipids of most membranes is such that the lipids are above their
 transition temperatures in their normal environment so that the bilayer is fluid The microviscosity of the fatty acyl groups
 decreases progressively down the chain so that at the hydrocarbon interior of the bilayer the lipid phase has a viscosity
 approximating that of olive oil at room temperature As a consequence of this membrane fluidity a phospholipid molecule is
 very mobile within the plane of the membrane moving a distance of about 1.2 μm in 1 s but the movement of a phospholipid
 molecule from one side of the membrane bilayer to the other flip flop is very slow The lipid bilayer is an essentially inert and
 rather impermeable structure as shown by many studies with model systems Proteins of course provide the catalytic
 components of the membranes as well as playing a significant structural role *Immobilization of Enzymes and Cells* José
 M. Guisán,2008-02-05 Enzymes and whole cells are able to catalyze the most complex chemical processes under the most
 benign experimental and environmental conditions In this way enzymes and cells could be excellent catalysts for a much
 more sustainable chemical industry However enzymes and cells also have some limitations for nonbiological applications fine
 chemistry food chemistry analysis therapeutics and so on Enzymes and cells may be unstable difficult to handle under
 nonconventional conditions poorly selective toward synthetic substrates and so forth From this point of view the
 transformation from the laboratory to industry of chemical processes catalyzed by enzymes and cells may be one of the most

complex and exciting goals in biotechnology For many industrial applications enzymes and cells have to be immobilized via very simple and cost effective protocols in order to be re used over very long periods of time From this point of view immobilization simplicity and stabilization have to be strongly related concepts Over the last 30 years a number of protocols for the immobilization of cells and enzymes have been reported in scientific literature However only very few protocols are simple and useful enough to greatly improve the functional properties of enzymes and cells activity stability selectivity and related properties
