Scientific and Technical Aerospace Reports , *Bulletin* United States. Office of Education, 1955 *Separated and Vortical Flow in Aircraft Wing Aerodynamics* Ernst Heinrich Hirschel, Arthur Rizzi, Christian Breitsamter, Werner Staudacher, 2020-10-04 Fluid mechanical aspects of separated and vortical flow in aircraft wing aerodynamics are treated. The focus is on two wing classes 1 large aspect ratio wings and 2 small aspect ratio delta type wings. Aerodynamic design issues in general are not dealt with. Discrete numerical simulation methods play a progressively larger role in aircraft design and development. Accordingly in the introduction to the book the different mathematical models are considered which underlie the aerodynamic computation methods: panel methods, RANS and scale resolving methods. Special methods are the Euler methods which as rather inexpensive methods embrace compressibility effects and also permit to describe lifting wing flow. The concept of the kinematically active and inactive vorticity content of shear layers gives insight into many flow phenomena but also with the second break of symmetry the first one is due to the Kutta condition an explanation of lifting wing flow fields. The prerequisite is an extended definition of separation flow off separation at sharp trailing edges of class 1 wings and at sharp leading edges of class 2 wings. The vorticity content concept with a compatibility condition for flow off separation at sharp edges permits to understand the properties of the evolving trailing vortex layer and the resulting pair of trailing vortices of class 1 wings. The concept also shows that Euler methods at sharp delta or strake leading edges of class 2 wings can give reliable results. Three main topics are treated: 1 Basic Principles are considered: first boundary layer flow, vortex theory, the vorticity content of shear layers, Euler solutions for lifting wings, the Kutta condition in reality and the topology of skin friction and velocity fields. 2 Unit Problems treat isolated flow phenomena of the two wing classes. Capabilities of panel and Euler methods are investigated. One Unit Problem is the flow past the wing of the NASA Common Research Model. Other Unit Problems concern the lee side vortex system appearing at the Vortex Flow Experiment 1 and 2 sharp and blunt edged delta configurations at a delta wing with partly round leading edges and also at the Blunt Delta Wing at hypersonic speed. 3 Selected Flow Problems of the two wing classes. In short sections practical design problems are discussed. The treatment of flow past fuselages although desirable was not possible in the frame of this book. *Journal of Aircraft* , 2009 *Technical Abstract Bulletin* , 1982 Confidential Documents United States. Army Air Forces, 1943 *Flight* , 1923 Flight and Aircraft Engineer , 1954 **On Subscale Flight Testing** Alejandro Sobron, 2018-11-05. Downscaled physical models also referred to as subscale models have played an essential role in the investigation of the complex physics of flight until the recent disruption of numerical simulation. Despite the fact that improvements in computational methods are slowly pushing experimental techniques towards a secondary role as verification or calibration tools, real world testing of physical prototypes still provides an unmatched confidence. Physical models are very effective at revealing issues that are sometimes not correctly identified in the virtual domain and hence can be a valuable complement to

other design tools But traditional wind tunnel testing cannot always meet all of the requirements of modern aeronautical research and development It is nowadays too expensive to use these scarce facilities to explore different design iterations during the initial stages of aircraft development or to experiment with new and immature technologies Testing of free flight subscale models referred to as Subscale Flight Testing SFT could offer an affordable and low risk alternative for complementing conventional techniques with both qualitative and quantitative information The miniaturisation of mechatronic systems the advances in rapid prototyping techniques and power storage as well as new manufacturing methods currently enable the development of sophisticated test objects at scales that were impractical some decades ago Moreover the recent boom in the commercial drone industry has driven a quick development of specialised electronics and sensors which offer nowadays surprising capabilities at competitive prices These recent technological disruptions have significantly altered the cost benefit function of SFT and it is necessary to re evaluate its potential in the contemporary aircraft development context This thesis aims to increase the comprehension and knowledge of the SFT method in order to define a practical framework for its use in aircraft design focusing on low cost short time solutions that don t require more than a small organization and few resources This objective is approached from a theoretical point of view by means of an analysis of the physical and practical limitations of the scaling laws and from an empirical point of view by means of field experiments aimed at identifying practical needs for equipment methods and tools A low cost data acquisition system is developed and tested a novel method for semi automated flight testing in small airspaces is proposed a set of tools for analysis and visualisation of flight data is presented and it is also demonstrated that it is possible to explore and demonstrate new technology using SFT with a very limited amount of economic and human resources All these together with a theoretical review and contextualisation contribute to increasing the comprehension and knowledge of the SFT method in general and its potential applications in aircraft conceptual design in particular
