Stochastic Modelling in Physical Oceanography Robert Adler, Peter Müller, B.L. Rozovskii, 2012-12-06 The study of the ocean is almost as old as the history of mankind itself When the first seafarers set out in their primitive ships they had to understand as best they could tides and currents eddies and vortices for lack of understanding often led to loss of life These primitive oceanographers were of course primarily statisticians They collected what empirical data they could and passed it down initially by word of mouth to their descendants Data collection continued throughout the millennia and although data bases became larger more reliable and better codified it was not really until surprisingly recently that mankind began to try to understand the physics behind these data and shortly afterwards to attempt to model it The basic modelling tool of physical oceanography is today the partial differential equation Somehow we all know that if only we could find the right set of equations with the right initial and boundary conditions then we could solve the mysteries of ocean dynamics once and for all

Neptune and Triton Dale P. Cruikshank, Mildred Shapley Matthews, A. M. Schumann, 1995-11 The first reconnaissance of all the major planets of the Solar System culminated in the Voyager 2 encounter with Neptune in August 1989 Neptune itself

was revealed as a planet with gigantic active storms in its atmosphere and off center magnetic field and a system of tenuous lumpy rings Whereas only two satellites were known prior to the encounter Voyager discovered six more Triton the largest satellite was revealed as a frozen icy world with clouds and layers of haze and with vertical plumes of particles reaching five miles into the thin atmosphere This latest Space Science Series volume presents the current level of understanding of Neptune its rings and its satellites derived from the data received from the Voyager The book's chapters are written by the world's leading authorities on various aspects of the Neptune system and are based on papers presented at an international conference held in January 1992 Covering details of Neptune's interior atmosphere rings magnetic fields and near space environment as well as the small satellites and the remarkable moon Triton this volume is a unique resource for planetary scientists and astronomers requiring a comprehensive analysis of Neptune viewed in the context of our knowledge of the other giant planets Until another spacecraft is sent to Neptune Neptune and Triton will stand as the basic reference on the planet **The Voyager Neptune Travel Guide**, 1989 *Ocean Modeling and Parameterization* Eric P.

Chassignet, Jacques Verron, 2012-12-06 The realism of large scale numerical ocean models has improved dramatically in recent years in part because modern computers permit a more faithful representation of the differential equations by their algebraic analogs Equally significant if not more so has been the improved understanding of physical processes on space and time scales smaller than those that can be represented in such models Today some of the most challenging issues remaining in ocean modeling are associated with parameterizing the effects of these high frequency small space scale processes Accurate parameterizations are especially needed in long term integrations of coarse resolution ocean models that are designed to understand the ocean variability within the climate system on seasonal to decadal time scales Traditionally parameterizations of subgrid scale high frequency motions in ocean modeling have been based on simple formulations such as the Reynolds decomposition with constant diffusivity values Until recently modelers were concerned with first order issues such as a correct representation of the basic features of the ocean circulation As the numerical simulations become better and less dependent on the discretization choices the focus is turning to the physics of the needed parameterizations and their numerical implementation At the present time the success of any large scale numerical simulation is directly dependent upon the choices that are made for the parameterization of various subgrid processes **Neptune and the Final Phase of the**

Piscean Age Sioux Rose, 2004-10-13 This volume functions as two books in one An astrologer's reference it delineates Neptune's conjunctions with planets from the birth chart Additionally since the astrologer is trained to step outside the temporal context to understand the magnitude of stories inlaid into the rhythm structures of time its perspective is valuable as mankind faces a chaotic transition The ancient Greeks personified the planetary personae through myth Neptune the deceiver presides over the final phase of the Piscean Age as deception delusion and duplicity threaten the great verities How did we get here Mankind evidences remarkable technological expertise but have matters improved for the vast majority

Illusions born of past traditions hold minds hostage and pit tribe against tribe on the basis of divisive belief systems Pisces is the zodiac position where the circle meets itself and differences dissolve Symbolized by two fish it suggests twin perceptual portals analogous to both brain hemispheres Two complementary oars are required to navigate our shared vessel progressively otherwise we circle endlessly and history repeats Right brain sentience invokes what is missing the sense of inherent unity among all living beings Mankind can no longer afford the asymmetric worldview that undermines the great balance we must now endeavor to restore
