Cognitive Development

Piaget's 4 Stages of Cognitive Development

1) Sensorimotor Stage (birth to 2 yrs)

- Children learn to explore stimulation
- Children learn doing with thinking
- Cognitive contents of experience
- Challenge = object permanence

Object Permanence

Birth to 3 months

- Turn head toward stimulus. But if it's moved, a child's eyes might not follow it.

3 months

- Follow moving objects with eyes. Stares at the spot that an object disappeared but will not search for it.

5 months

- Grasp and manipulate objects and anticipates the future position of an object

8 months

- Starts searching for an object that's hidden. Shows "A not B" effect.
- Will search for an object at the last place they found it, not the last place they saw it.

12 months

- Searches in the last place they saw the object.

A schema is a mental representation or organized set of related perceptions

Assimilation - new information is modified to fit within an existing schema.
Accommodation - the pre-existing schema is modified by new experiences.

Representational thought - the ability to form mental images separately from the end of the sensorimotor period.
Important in imitation, delayed imitation, symbolic play, and language.

2) Preconventional Stage (2 to 7 yrs)

- Can't think logically
- Rapid language development
- Classify and categorize objects
- Cannot find manipulated objects
- Imagining = conservation

Conservation is the understanding that specific properties of objects (e.g. weight, volume, number) remain the same despite apparent changes and rearrangements of those objects.

Experimentation - a child's belief that others see the world as primarily the same way that they do

3) Concrete Operational Stage (7 to 11 yrs)

- Can learn to find answers
- Engage with thoughts and feelings at once
- Logical and logical-mathematical effect
- Reason and thought
- Classification - self classifies according to a specific feature

4) Formal Operations Stage (11 yrs)

- Use abstract reasoning by constructing hypothetical thoughts
- Meta-cognition
- dependent on exposure to principles of scientific thinking

Evaluating Piaget's Theory

Children don't seem to start with nothing. Space and objects.

- Visual cliff - perceive depth around the time they can crawl.
- Effect of education - prefer to look at novel things from 4 months.
- Understanding of support - from 6 months
- Object permanence - 18 mos is earlier appears to represent difficulty understanding water bucket.

Number and Mathematical Reasoning

Early research - kids show some understanding of numbers. Young child 3 months then a group of 4 things with a group of 3 things. Child was more likely at the latter.

Social Cognition

- newborn babies would rather see an adult than a decorated one.
- At 3 months old, infants will attempt to read and facial expressions.
- 7 months old will look in the direction of their mother's gaze.

Cognitive Developmental Theories
All children apply common sense.

1) Piaget's Stages of Development

- Learning from when they don't see the right answers, children understand what learning is all about.

However, Learning - could Piaget's theory be too narrow? Could there be more to be learned from a group of children? Children's learning is not necessarily conservative.

2) Social Cognition in preschoolers

- Experimentation. Piaget thought they were egocentric with 3 years old. But from 3 and 4-year-olds can pass a dilemma. Then it's relevant. At 3.5 to 4, children will turn a book around to an adult can see it, and turn a book when talking to young children. Children under 4 year old work to the what their mother is saying at 4 years old and understand that someone else has a different viewpoint.

Theory of Mind. This is a group of skills relating to the understanding of the distinct of other people's minds, e.g. intentions, likes and dislikes. Allowed to be a theory in social interaction.

General facts and theories. Emotionally. Children from 18 months old have some but experimental work.

4 months - kids gave when they had.

- True and False beliefs. False belief task. You can see that there is a rubber duck in the basket. 4-year-olds correctly think that a person who has not seen the contents of the box will believe there are no ducks in the box. 3-year-olds will think that other people will think that there is a rubber duck in the box.

Social and Moral Development

Principle of Moral Sufficiency
- Children will understand a certain way of acting better if there is just enough pressure to get them to behave in that way, but not enough to pressure them, forcing them to do the task.

Dimensions

Moral Reasoning	Demandingness	
	High	Low
Authoritative	Authoritative	Permissive
Authoritarian	Authoritarian	Disengaged

Children's Theory of Moral Development

Shaped best between 10 and 11-year-old. Presented the subject with moral questions scenarios, e.g. wife dying and husband can't afford medication, breaks into store and steals drugs.

Preconventional Level

Behavior is based on external sanctions, such as authority and punishment.
Stage 1: Morality of punishment and obedience

- Child obey authority and avoid punishment.

Stage 2: Morality of naive instrumental hedonism

- Behaviour guided essentially by the pleasantness of its consequences to them.

Conventional Level

Subject an understanding that the social system has an interest in proper behavior.

Stage 3: Morality of maintaining good relations

- Children want to be regarded as good, well-behaved people.

Stage 4: Morality of maintaining social order

- Law and moral rules maintain social order and must be obeyed.

Post-Conventional Level

Moral rules have some underlying principles that apply to all situations and societies.

Stage 5: Morality of social contracts

Law and social contracts, not all authority figures are obligated to demand rights, can sometimes take precedence over laws.

Stage 6: Morality of universal ethical principles

- Rules and laws are justified by abstract ethical ways, e.g. when it becomes too hard to justify.
