Borradaile, 2013-11-11 The Goals of Data Collection and Its Statistical Treatment in the Earth Sciences The earth sciences are characterised by loose and complex relationships between variables and the necessity to understand the geographical distribution of observations as well as their frequency distribution Our fre

quency distributions and the looseness of relationships reflect the complexity and intrinsic natural variation in nature more than measurement error. Furthermore, earth scientists cannot design experiments according to statistical recommendation because the availability and complexity of data are beyond our control. Usually, the system we are studying cannot be isolated into discrete independent variables. These factors influence the first steps of research: how and where to collect specimens or observations. Some issues are particularly troublesome and common in earth science but are rarely handled in an undergraduate statistics course. These include spatial sampling methods, orientation data, regionalised variables, time series, identification of cyclicity and pattern discrimination, multivariate systems, lurking variables, and constant sum data. It is remarkable that most earth science students confront these issues without formal training or focused consideration.

Tidal Friction and the Earth's Rotation Peter Brosche, 2013-12-01
P. Brosche: The development of the ideas and observational techniques related to the subject of our meeting. Tidal friction and the Earth's rotation. Bielefeld, September 1977. This is one of the most fascinating books, not merely chapters of the modern history of science. Its genealogical tree is as intricate as that of mankind itself. There are dead ends and superfluous re-discoveries. Due to these circumstances and to the pure extent of the topic, it is impossible to give more than a few highlights here. The first relevant observational fact was discovered by the famous English astronomer E. Halley in 1695. Berry (1961) simply could not arrive at an agreement between ancient and recent eclipses using a constant mean angular motion of the Moon. Instead, he had to introduce an empirical acceleration term in the mean motion. Known as the secular acceleration, it has ever since been a most challenging subject of celestial mechanics and a main branch of the genealogical tree already mentioned. In 1754, completely independently and almost certainly in ignorance of those specialists' activities, the German philosopher Kant established the idea of tidal friction as a decelerating mechanism for the rotation of the Earth. Felber (1974). Although he made some errors in his rough computations, the majority of the constitutive elements of his concept have survived to the present day. Brosche (1977).

Geological Evolution of the Earth During the Precambrian L.J. Salop, 2012-12-06
Progress in Precambrian geology has been exceptionally great, indeed quite striking. For geologists of the older generation, only some 30-40 years ago, the Precambrian appeared as an uncertain and even mystic prelude to geologic evolution. Even the very name Precambrian means some indivisible unit in the early history of the Earth, the beginning of which is poorly known. At the same time, it was obvious that the Precambrian formations are of extremely varied and complex composition, and poor knowledge and lack of reliable methods of division and correlation were to blame for the lack of significant progress in studies of this early evolutionary stage of the planet. Certainly, even at the very start of Precambrian studies, the results obtained were quite promising, lifting as they did the mysterious veil over the regional Precambrian, but they presented no general realistic picture of this early stage in the Earth's evolution at that time. Recently, this situation has completely changed due to new methods of study of the older formations and due also to the refinement of some well-known methods, in particular of division, dating, and correlation of silent

metamorphic strata Application of different isotope methods of dating was most important in providing objective rock age and thereby the age of geologic events recorded in these rocks Thus it became possible to reconstruct the oldest geologic period of our planet The Space Economy in Figures Responding to Global Challenges OECD,2023-12-15 Key priorities
