NMR Applications in Biopolymers John W. Finley, Siegfried J. Schmidt, A.S. Serianni, 2012-12-06 Elucidating the structures of biopolymers as they exist in nature has long been a goal of biochemists and biologists Understanding how these substances interact with themselves other solutes and solvents can provide useful insights into many areas of biochemistry agriculture food science and medicine Knowledge of the structure of a protein or complex carbohydrate in its native form provides guidelines for the chemical or genetic modifications often desired to optimize these compounds to specific needs and applications For example in the pharmaceutical industry structure function relationships involving biopolymers are studied routinely as a means to design new drugs and improve their efficacies The tools to conduct structure investigations of biopolymers at the molecular level are limited in number Historically X ray crystallography has been the most attractive method to conduct studies of this type However X ray methods can only be applied to highly ordered crystalline materials thus obviating studies of solution dynamics

that are often critical to attaining a global understanding of biopolymer behavior In recent years nuclear magnetic resonance NMR spectroscopy has evolved to become a powerful tool to probe the structures of biopolymers in solution and in the solid state NMR provides a means to study the dynamics of polymers in solution and to examine the effects of solute solvent and other factors on polymer behavior With the development of 2D and 3D forms of NMR spectroscopy it is now possible to assess the solution conformations of small proteins oligonucleotides and oligosaccharides

Fourier Transforms in NMR, Optical, and Mass Spectrometry A.G. Marshall, F.R. Verdun, 2016-02-25

Written by spectroscopists for spectroscopists here is a book which is not only a valuable handbook and reference work but also an ideal teaching text for Fourier transform methods as they are applied in spectroscopy. It offers the first unified treatment of the three most popular types of FT spectroscopy with uniform notation and complete indexing of specialized terms. All mathematics is self contained and requires only a knowledge of simple calculus. The main emphasis is on pictures and physical analogs rather than detailed algebra. Instructive problems presented at the end of each chapter offer extensions of the basic treatment. Solutions are given or outlined for all problems. The book offers a wealth of practical information to spectroscopists. Non ideal effects are treated in detail: noise source and detector limited, non linear response limits to spectrometer performance based on finite detection period, finite data size, mis phasing etc. Common puzzles and paradoxes are explained e.g. use of mathematically complex variables to represent physically real quantities, interpretation of negative frequency signals on resonance vs off resonance response, interpolation when it helps and when it doesn't, ultimate accuracy of the data, differences between linearly and circularly polarized radiation, multiplex advantage or disadvantage etc. Chapter 1 introduces the fundamental line shapes encountered in spectroscopy from a simple classical mass on a spring model. The Fourier transform relationship between the time domain response to a sudden impulse and the steady state frequency domain response, absorption and dispersion spectra to a continuous oscillation is established and illustrated. Chapters 2 and 3 summarize the basic mathematics, definitions, formulas, theorems and examples for continuous analog and discrete digital Fourier transforms and their practical implications. Experimental aspects which are common to the signal, Chapter 4 and noise, Chapter 5 in all forms of Fourier transform spectrometry are followed by separate chapters for treatment of those features which are unique to FT MS, FT optical, FT NMR and other types of FT spectroscopy. The list of references includes both historical and comprehensive reviews and monographs along with articles describing several key developments. The appendices provide instant access to FT integrals and fast algorithms as well as a pictorial library of common Fourier transform function pairs. The comprehensive index is designed to enable the reader to locate particular key words including those with more than one name.

Organic Spectroscopy Jag Mohan, 2004-12. Though the format evolved in the first edition remains intact, relevant new additions have been inserted at appropriate places in various chapters of the book. Also included are a number of sample and study problems at the end of each chapter to illustrate the approach to problem solving that involve translations of sets of spectra into chemical structures. Written primarily to stimulate the interest of students in spectroscopy and make them aware of the latest developments in this field, this book begins with a general introduction to electromagnetic radiation and molecular spectroscopy. In addition to the usual topics on IR, UV, NMR and Mass spectrometry, it includes substantial material on the currently useful techniques such as FT IR, FT NMR, ^{13}C NMR, 2D NMR, GC MS, FAB MS, Tandem and Negative Ion Mass Spectrometry for students engaged in advanced studies. Finally, it gives a detailed account on Optical Rotatory Dispersion (ORD) and Circular Dichroism (CD).

Multinuclear NMR J. Mason, 2012-12-06 With the power and range of modern pulse spectrometers the compass of NMR spectroscopy is now very large for a single book but we have undertaken this Our book covers the Periodic Table as multinuclear spectrometers do and introductory chapters are devoted to the essentials of the NMR experiment and its products Primary products are chemical shifts including anisotropies spin spin coupling constants and relaxation times the ultimate product is a knowledge of content and constitution dynamic as well as static Our province is chemical and biochemical rather than physical or technical only passing reference is made to metallic solids or unstable species or to practical NMR spectroscopy Our aim is depth as well as breadth to explain the fundamental processes whether of nuclear magnetic shielding spin spin coupling relaxation or the multiple pulse sequences that have allowed the development of high resolution studies of solids multidimensional NMR spectroscopy techniques for sensitivity enhancement and so on This book therefore combines the functions of advanced textbook and reference book For reasonably comprehensive coverage in a single volume we have summarized the information in tables and charts and included all leading references
