

Nuclear Science

Nuclear Science is the study of the structure, properties, and interactions of the atomic nucleus. Nuclear science includes and extends the topics: atoms, ions, and isotopes of matter as well as its synthesis. They all go together (well as "Why do we study this in the nucleus?" What combination of properties and energy is possible? What happens when nuclei are compressed or split apart? What is the origin of the matter found in Earth?

Expansion of the Universe

How do we know the universe expanded and cooled to form what we see today? The expansion of the universe is supported by several lines of evidence. The first is the observation that the universe is expanding. This is shown by the fact that galaxies are moving away from us, and the further away they are, the faster they are moving. This is known as Hubble's Law. The second line of evidence is the cosmic microwave background radiation. This is the afterglow of the Big Bang, and it is uniform in all directions. The third line of evidence is the abundance of light elements. The Big Bang produced a specific amount of hydrogen, helium, and lithium, and this is what we observe today.

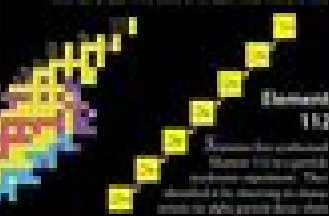

Phases of Nuclear Matter

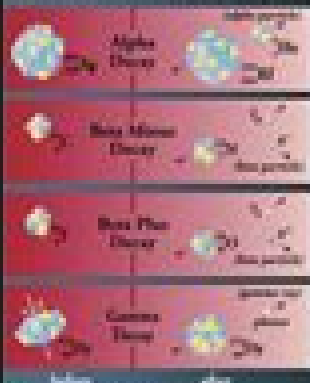

Nuclear matter is a state of matter that exists at extremely high densities and temperatures. It is a state of matter that is composed of nucleons (protons and neutrons) and is held together by the strong nuclear force. Nuclear matter is found in the cores of stars and in the remnants of supernovae. It is a state of matter that is very different from the states of matter that we are familiar with on Earth.

Unstable Nuclei

Some nuclei are unstable and will decay into more stable nuclei. This is known as radioactive decay. The rate at which a nucleus decays is characterized by its half-life. The half-life is the time it takes for half of the nuclei in a sample to decay. The half-life of a nucleus can range from a fraction of a second to billions of years.

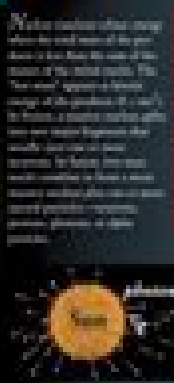

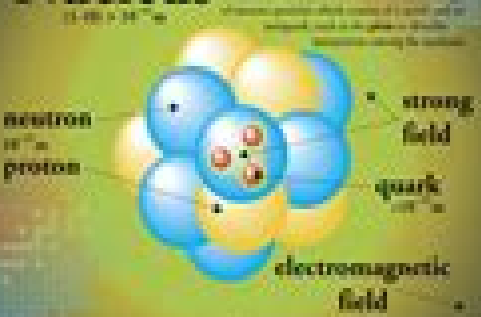

Radioactivity

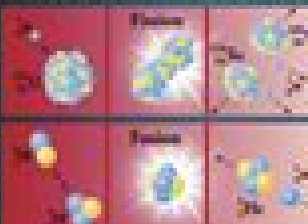

Radioactive decay is a process by which an unstable atomic nucleus loses energy by emitting ionizing particles. The particles emitted are a form of ionizing radiation that has the potential to ionize other atoms. The process of radioactive decay is a random process, and the rate at which a nucleus decays is characterized by its half-life. The half-life is the time it takes for half of the nuclei in a sample to decay. The half-life of a nucleus can range from a fraction of a second to billions of years.

The Nucleus

Nuclear Energy

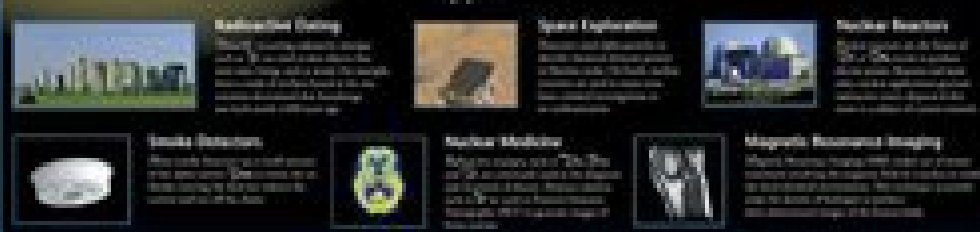

Nuclear energy is the energy that is released from the nucleus of an atom. It is a form of energy that is very different from the energy that we are familiar with on Earth. Nuclear energy is used to generate electricity and to power spacecraft. It is a form of energy that is very powerful and can be used for many different purposes.
