Submicroscopic Ortho- and Patho-Morphology of the Liver Heinz David, 2013-10-22 Submicroscopic Ortho and Patho Morphology of the Liver **Submicroscopic Cytodifferentiation** Milan Dvorak, 2012-12-06 The progressive changes which occur during the life history of an individual metazoon are summed up under the term development The adult multicellular organism differs from its early developmental stages by its size shape proportions and by its parts having gradually acquired different structural and functional properties Accordingly several main processes involved in development whose classification is a matter of convention may be delimited Differentiation is considered one of the most important of them In the broader sense of the word the term differentiation is used for describing transformations through which heterogeneity at all levels macroscopic microscopic submicroscopic arises or increases The basic component of the wider phenomenon of differentiation is differentiation of cells so called cytodifferentiation What is cytodifferentiation In the course of ontogeny the cells starting with the fertilized ovum via the blastomeres of the segmenting ovum and the germ layer cells right to the differentiating and fully differentiated cells of tissues and organs gradually acquire new properties which make them different both from a morphological and functional point of view All changes involved in this process come under the term cytodifferentiation Differentiation of cells though not of all kinds of cells continues throughout the entire life of the individual but reaches its maximum at the embryonic period when it becomes the chief feature of development *Structure of Space and the Submicroscopic Deterministic Concept of Physics* Volodymyr Krasnoholovets, 2017-07-06 This book Structure of Space and the Submicroscopic Deterministic Concept of Physics completely formalizes fundamental physics by showing that all space which consists of objects and distances arises from the same origin manifold of sets A continuously organized mathematical lattice of topological balls represents the primary substrate named the tessellattice All fundamental particles arise as local fractal deformations of the tessellattice The motion of such particulate balls through the tessellattice causes it to deform neighboring cells which generates a cloud of a new kind of spatial excitations named inertons Thus so called hidden variables introduced in the past by de Broglie Bohm and Vigier have acquired a sense of real quasiparticles of space This theory of space unambiguously answers such challenging issues as what is mass what is charge what is a photon what is the wave psi function what is a neutrino what are the nuclear forces and so on The submicroscopic concept uncovers new peculiar properties of quantum systems especially the dynamics of particles within a section equal to the particle's de Broglie wavelength which are fundamentally impossible for quantum mechanics This concept thoroughly discussed in the book allows one to study complex problems in quantum optics and quantum electrodynamics in detail to disclose an inner world of particle physics by exposing the structure of quarks and nucleons in real space and to derive gravity as the transfer of local deformations of space by inertons which in turn completely solves the problems of dark matter and dark energy Inertons have revealed themselves in a number of experiments carried out in condensed media plasma nuclear physics and

astrophysics which are described in this book together with prospects for future studies in both fundamental and applied physics
