Pneumatic Systems:

Pneumatic Drives Peter Beater, 2007-02-23 The idea to use air for transmitting power is very old Ctesibius in ancient Greece described a catapult using pneumatic cylinders to first store energy and then rapidly accelerate an arrow Heron of Alexandria developed automatic temple doors which opened and closed by means of hot air And from the Greek word for breath he coined the term that was used as title for his book and today describes a whole industry pneumatics Pneumatic components and systems have become an important topic for textbooks Most have their focus on the description of the steady state behaviour practical problems like troubleshooting or Boolean algebra to help designing control algorithms Only a few textbooks covering the theoretical analysis and design of pneumatic systems have been published Z manzon et al 1965 Andersen 1967 Andersson et al 1975 But they were written at a time when digital computers were not easily available to engineers and therefore contain few material about modelling and simulation This book tries to bridge the gap between scientific disciplines fluid mechanics thermodynamics mathematics control etc the conventional approach to describe pneumatic components and systems by their steady state behaviour the wish of a design engineer to test his design before actually building hardware and the resulting need for mathematical models in order to use today's powerful digital computers

U. S. Navy, 2009-02 The Regulus missile was a direct outgrowth of World War II. The success of Germany's V-1 buzz bombs and the awesome power of the atomic bomb suggested that developing a submarine-launched nuclear armed guided missile was an imperative. The Chance Vought Aircraft Company won the contract for Regulus with a bold proposal. Their missile resembled a pilotless jet aircraft and during the test phase was equipped with landing gear allowing the missile to be recovered rather than expended during the tests. Regulus would be radio controlled either by a chase aircraft or by a nearby ship or submarine and it could carry a nuclear payload. JATO boosters enabled submarine launch of the Regulus. It would be deployed aboard five submarines. They conducted the nation's first nuclear deterrent patrols off the coast of the Soviet Union in 1959-1964. Originally printed by the U.S. Navy and Chance Vought, this handbook was restricted. It was declassified and is here reprinted in book form.

Presenting transient response analyses of first and second order systems subjected to various inputs, the book provides a thorough discussion of computational analyses of transient responses using MATLAB Simulink and 20-sim software. It introduces the Lagrangian method and its application in handling mechanical and electrical systems. The book reviews the classical method for solving differential equations and includes Laplace transforms. The book is intended for upper-level undergraduate mechanical and aerospace engineering students taking system dynamics courses.
