We investigate the structure attained by neutron star matter composed with protons, neutron and electrons, with proton percentages ranging from 10% 50% (symmetric case), densities in the range of $0.02 \text{ fm}^{-3} < \rho < 0.085 \text{ fm}^{-3}$, and temperatures $0 \text{ MeV} < T < 4 \text{ MeV}$. In particular we study the pasta shapes and the topological phase changes previously observed in nuclear matter, as well as the behavior of the nuclear symmetry energy in these infinite cases. We corroborate the existence of homogeneous to non-homogeneous phase transitions, and the different values of the symmetry energy at different densities and temperatures.
