Portfolio Analysis of Power Plant Technologies Sebastian Rothe, 2019-03-12 The liberalization process tightening environmental standards and the need for replacing aged power plants force European utilities to optimize their future generation mix Power plants are real assets and as a consequence the power plant park of a utility firm equals a portfolio of different generation assets This thesis adds to the understanding how to identify an efficient generation portfolio through time by assuming a non constant feasible set According to our results a combination of conventional thermal and renewable energies turn out to be efficient in terms of expected value and risks Therefore implementing a strategy based on renewable energies which cause less CO₂ per MWh generated electricity clearly pays off Potential readership includes scholars from energy economics and energy finance as well as interested practitioners involved in these areas
