Foundations of Structural Biology Leonard J. Banaszak, 2000-02-08 Imagine trying to understand an engine without visualizing its moving parts Biological processes involve far more complex chemical reactions and components than any engine Furthermore the parts work together to do many more functions than an engine which sole task is to turn a shaft Understanding the implications of the three dimensional coordinates for a molecule with several thousand atoms requires an understanding of and practice with 3D imaging For many biologists this means acquiring a whole new set of skills *Foundations of Structural Biology* is aimed at helping the reader develop visualization skills for protein or DNA segments while also describing the fundamental principles underlying the organization and interaction between these complex molecules Key Features Explains how to use coordinate databases and atomic coordinates of biological macromolecules Teaches the skills of stereoviewing Contains computer generated stereographics Describes the principles of symmetry and handedness in proteins and DNA Introduces metal and lipid binding proteins and DNA protein interactions Explains the principles involved in understanding secondary and quaternary structure Includes coverage of protein metal protein nucleic acid and protein lipid interactions

Handbook of Computational Chemistry Jerzy

Leszczynski, 2012-01-13 The role of the Handbook of Computational Chemistry is threefold. It is primarily intended to be used as a guide that navigates the user through the plethora of computational methods currently in use; it explains their limitations and advantages and it provides various examples of their important and varied applications. This reference work is presented in three volumes. Volume I introduces the different methods used in computational chemistry. Basic assumptions common to the majority of computational methods based on molecular quantum or statistical mechanics are outlined and special attention is paid to the limits of their applicability. Volume II portrays the applications of computational methods to model systems and discusses in detail molecular structures, the modelling of various properties of molecules and chemical reactions. Both ground and excited states properties are covered in the gas phase as well as in solution. This volume also describes Nanomaterials and covers topics such as clusters, periodic and nano systems. Special emphasis is placed on the environmental effects of nanostructures. Volume III is devoted to the important class of Biomolecules. Useful models of biological systems considered by computational chemists are provided and RNA, DNA and proteins are discussed in detail. This volume presents examples of calculations of their properties and interactions and reveals the role of solvents in biologically important reactions as well as the structure-function relationship of various classes of Biomolecules.
