

Purpose

This guideline describes the practical aspects of blood component administration including:

- Intravenous access
- Administration sets
- Compatibility of other infusion fluids
- Infusion devices
- Blood warmers
- Pressure devices and rapid infusers

Practical aspects of blood component administration

Medicines should never be added to blood components. No other labels should be attached to a transfusion pack.

Intravenous cannulae

Blood components can be transfused through most peripheral or central venous catheters, although the flow rate is reduced by narrow lumen catheters and long peripherally inserted central catheters (PICC lines).

The minimum diameter of cannula recommended for infusion of blood in adults is 18G (green) although smaller gauge may be used. For rapid transfusion, large bore cannulae e.g. 14G (orange) are required. All blood components can be slowly infused through smaller gauge cannulae or needles. Needles as small as 23G (blue) have been used successfully for transfusion in paediatric practice. 24G (yellow) cannulae are used for neonates.

If a SmartSite® needle-free valve is in situ this must be removed prior to rapid / emergency transfusion. This is to ensure the required flow-rate is not impeded.

Central lines

Central lines are generally suitable for transfusion of blood components.

Blood and other solutions can be infused through the separate lumens of multi-lumen central venous catheters as rapid dilution occurs in the bloodstream. Where possible, one lumen should be reserved for the administration of blood components.
