## Summary of Investment Cash Flow Valuation of Bonds, Preferred Stock, and Common Stock

Bonds and preferred stock claim a guaranteed cash payment to the security holder. In the case of a bond, interest and principal cash is paid in accordance with the terms of the bond contract (protection). Preferred stocks have stated dividend rates, which are deducted by the holder for their value of the preferred stock, based on its perceived residual dividends. Both bonds and preferred stock are valued by discounting future expected cash flows back to the present. However, since these are perceived cash flows, we discount the cash flows plus a premium rate of return or risk premium to reflect the market price of similar securities. Common stocks, on the other hand, do not have a contracted dividend payment, so we apply the discount rate used for bonds in this manner by estimating expected future dividends and then discounting them back to the present using the expectation of value that an investor would require if investing in a stock with the risk premium of the shares being valued.

Type of Security	Expected Cash Flow	Discount Rate	Valuation Model
Bond	Promised interest and principal payments. These payments are set based on the contract between the bond issuing company and the owner of the bond.	Market's required yield to maturity (YTM) measure. Typically the YTM on a similar bond is used to value a bond. This YTM is the realized rate of return to the bondholder only if all promised payments are made on time. Consequently, the yield to maturity calculated for a bond is a promised yield and not the expected yield.	Value = $\frac{1}{1 + \text{YTM, market}} + \frac{1}{(1 + \text{YTM, market})^2} + \dots + \frac{\text{Principal}}{(1 + \text{YTM, market})^{n_{\text{years}}}}$
Preferred stock	Promised dividends. Dividends are defined using a constant rate, or dividend yield that is multiplied by the current fair value of the preferred stock to get the preferred stock dividend.	Market or promised yield on preferred stock. This typically involves this yield using market perceived promised dividends for similar classes of preferred stock. This yield is a promised yield that will only be earned if the preferred stock dividends are fully paid every period as promised.	Value of Preferred Stock ( $P_0$ ) = $\frac{\text{Annual Preferred Stock Dividend}}{\text{Market Required Yield on Preferred Stock}}$
Common stock	Expected future dividends. No dividend is guaranteed for common stock. Instead dividends must be estimated, or an estimated discount rate applied to the present value of future dividends.	Investor's expected rate of return, which is the investor's required rate of return. Since common stock dividends are risky we add a risk premium to the dividend and discount them using a risk-adjusted or expected rate of return. The resulting fair value of stock is then compared back to the common stock being valued. We can estimate this expected rate of return using the CAPM.	Value of Common Stock ( $P_0$ ) = $\frac{\text{Div}_1 \times (1 + g)}{r_c - g}$
