Selected Applications Of Nonlinear Programming:

Selected Applications of Nonlinear Programming Jerome Bracken, Garth P. McCormick, 1968 Nonlinear Programming Anthony V. Fiacco, Garth P. McCormick, 1990-01-01 Recent interest in interior point methods generated by Karmarkar's Projective Scaling Algorithm has created a new demand for this book because the methods that have followed from Karmarkar's bear a close resemblance to those described. There is no other source for the theoretical background of the logarithmic barrier function and other classical penalty functions. Analyzes in detail the central or dual trajectory used by modern path following and primal dual methods for convex and general linear programming. As researchers begin to extend these methods to convex and general nonlinear programming problems, this book will become indispensable to them.

More Test Examples for Nonlinear Programming Codes Klaus Schittkowski, 2012-12-06 This collection of 188 nonlinear programming test examples is a supplement of the test problem collection published by Hock and Schittkowski 2. As in the former case, the intention is to present an extensive set of nonlinear programming problems that were used by other authors in the past to develop test or compare optimization algorithms. There is no distinction between an easy or difficult test problem since any related classification must depend on the underlying algorithm and test design. For instance, a nonlinear least squares problem may be solved easily by a special purpose code within a few iterations, but the same problem can be unsolvable for a general nonlinear programming code due to ill conditioning. Thus, one should consider both collections as a possible offer to choose some suitable problems for a specific test frame. One difference between the new collection and the former one published by Hock and Schittkowski 2 is the attempt to present some more realistic or real world problems. Moreover, a couple of nonlinear least squares test problems were collected which can be used, e.g., to test data fitting algorithms. The presentation of the test problems is somewhat simplified, and numerical solutions are computed only by one nonlinear programming code, the sequential quadratic programming algorithm NLPQL of Schittkowski 3. But both test problem collections are implemented in the same way in form of special FORTRAN subroutines so that the same test programs can be used.

Multi-objective Optimization: Techniques And Applications In Chemical Engineering (Second Edition)

Gade Pandu Rangaiah, 2016-12-22 Optimization is now essential in the design, planning, and operation of chemical and related processes. Although process optimization for multiple objectives was studied in the 1970s and 1980s, it has attracted active research in the last 15 years, spurred by the new and effective techniques for multi-objective optimization (MOO). To capture this renewed interest, this monograph presents recent research in MOO techniques and applications in chemical engineering. Following a brief introduction and review of MOO applications in chemical engineering since 2000, the book presents selected MOO techniques and many chemical engineering applications in detail. In this second edition, several chapters from the first edition have been updated; one chapter is completely revised, and three new chapters have been added. One of the new chapters describes three MS Excel programs useful for MOO of application problems. All the chapters will be

of interest to researchers in MOO and or chemical engineering Several exercises are included at the end of many chapters for use by both practicing engineers and students

Optimization in Mechanics P. Brousse, 2013-10-22 Optimization in Mechanics Problems and Methods investigates various problems and methods of optimization in mechanics The subjects under study range from minimization of masses and stresses or displacements to maximization of loads vibration frequencies and critical speeds of rotating shafts Comprised of seven chapters this book begins by presenting examples of optimization problems in mechanics and considering their application as well as illustrating the usefulness of some optimizations like those of a reinforced shell a robot and a booster The next chapter outlines some of the mathematical concepts that form the framework for optimization methods and techniques and demonstrates their efficiency in yielding relevant results Subsequent chapters focus on the Kuhn Tucker theorem and duality with proofs associated problems and classical numerical methods of mathematical programming including gradient and conjugate gradient methods and techniques for dealing with large scale problems The book concludes by describing optimizations of discrete or continuous structures subject to dynamical effects Mass minimization and fundamental eigenvalue problems as well as problems of minimization of some dynamical responses are studied This monograph is written for students engineers scientists and even self taught individuals
