Spectral Techniques In Proteomics Daniel S. Sem, 2007-03-30 Facilitating the innovation development and application of new spectroscopic methods in proteomics Spectral Techniques in Proteomics provides a broad overview of the spectroscopic toolbox that can be used either with proteome or sub proteome mixtures or with individual purified proteins studied in parallel It gives a modest overview of

Vaccine Design Michael F. Powell, Mark J. Newman, 2012-12-06 When my interest was first drawn to the phenomenon of vaccination for virus diseases in the late 1930s the state of the art and the science of vaccine design was not far advanced beyond the time of Jenner at the end of the 18th century and of Pasteur a century later In the 1930s it was still believed that for the induction of immunity to a virus caused disease the experience of infection was required but not for a toxin caused disease such as diphtheria or tetanus for which a chemically detoxified antigen was effective for immunization This prompted the question as to whether it might be possible to produce a similar effect for virus diseases using nonreplicating antigens When in the 1930s and 1940s it was found possible to propagate influenza viruses in the chick embryo protective effects could be induced without the need to experience infection by the use of a sufficient dose of a noninfectious influenza virus preparation Later in the 1940s it became possible to propagate polio and other viruses in cultures of human and monkey tissue and to immunize against other virus diseases in the same way Later with the advent of the era of molecular biology and genetic engineering antigens and vaccines could be produced in new and creative ways using either replicating or nonreplicating forms of the appropriate antigens for inducing a dose related protective state
