8. Rotary Lobe Pump

A lobe pump (Figure 1.19) is similar to an external gear pump, in that the liquid is carried between the rotor lobe surfaces that cooperate with each other as they rotate to provide continuous sealing, as do the teeth of a gear pump. Unlike a gear pump, however, one lobe cannot drive the other, so this type of pump must have timing gears (described in Section VI.C.6 and shown in Figure 1.20) to allow the lobes to remain in synch with each other. Each rotor may have one lobe or several, with three lobes being most common.
