and available software Chapters cover mathematical analysis the structure of the space of cellular automata learning rules with specified properties cellular automata in biology physics chemistry and computation theory and generalizations of cellular automata in neural nets Boolean nets and coupled map lattices Current work on cellular automata may be viewed as revolving around two central and closely related problems the forward problem and the inverse problem The forward problem concerns the description of properties of given cellular automata Properties considered include reversibility invariants criticality fractal dimension and computational power The role of cellular automata in computation theory is seen as a particularly exciting venue for exploring parallel computers as theoretical and practical tools in mathematical physics The inverse problem an area of study gaining prominence particularly in the natural sciences involves designing rules that possess specified properties or perform specified task A long term goal is to develop a set of techniques that can find a rule or set of rules that can reproduce quantitative observations of a physical system Studies of the inverse problem take up the organization and structure of the set of automata in particular the parameterization of the space of cellular automata Optimization and learning techniques like the genetic algorithm and adaptive stochastic cellular automata are applied to find cellular automaton rules that model such physical phenomena as crystal growth or perform such adaptive learning tasks as balancing an inverted pole Howard Gutowitz is Collaborateur in the Service de Physique du Solide et Resonance Magnetique Commissariat a l'Energie Atomique Saclay France **In Equity** United States.
