

SEX-RELATED COGNITIVE DIFFERENCES

An Essay on Theory and Evidence

JULIA A. SHERMAN, Ph.D.

*Director, Women's Research Institute of Wisconsin, Inc.
Madison, Wisconsin*

This provocative book, written by one of the leading authorities in the field, provides a review and critical evaluation of accepted theories of sex-related differences in cognitive functioning. Doctor Sherman, backed by careful research and meticulous analysis, openly challenges existing opinions on this subject. She concludes that, when relevant variables are controlled, there are no appreciable sex-related differences in verbal, spatial, mathematical or other cognitive skills.

From Sex Differences in Neuroscience to a Neuroscience of Sex Differences: New Directions and Perspectives Belinda Pletzer, 2015

This research topic aims to integrate scattered findings on sex differences in neuroscience into a broader theory of how the human brain is shaped by sex and sex hormones in order to cause the great variety of sex differences that are commonly observed. It can be assumed that these differences didn't occur arbitrarily but that they rather determined and still determine evolutionary success of individuals and were shaped by the processes of natural and in particular sexual selection. Therefore sex differences are not negligible and sex difference research cannot be discriminating against one sex or the other. In fact a better understanding of the underlying causes of sex differences has great advantages for both men and women and society as a whole not only in terms of health care but in every aspect of life. Gender equality can only work out if it is equally well understood for men and women what their individual resources and needs are. Therefore it is of great importance to pave the way for identifying the underlying principles of structural and functional brain organization that cause men and women to act, think and feel differently. To this end it is of particular interest to identify possible similarities and interrelations between sex differences that did so far stand separately in order to investigate whether they share a common source. To understand where a specific sex difference comes from and whether or not it is caused by the same principle as other sex differences it is necessary to explicitly link sex differences in behavior to their neuronal correlates and vice versa link sex differences in brain structure and function to their behavioral outcomes. In particular a new understanding of male and female brain functioning may arise from findings on how sex hormones interact with various neurotransmitter systems. In the past few years several findings demonstrated that women's behavior is influenced by the sex hormone fluctuations they experience naturally during their menstrual cycle to the extent that sex differences may only be detectable in one cycle phase but not another. The study of menstrual cycle dependent effects gives important hints about which sex differences are activational and which are organizational. Additionally it only recently came to attention that hormonal contraception may alter a woman's mood, cognition and behavior as a consequence of changes in brain structure and function. The underlying mechanisms are so poorly understood that it is even hard to predict whether hormonal contraception will mask or amplify sex differences in a given task. Since the oral hormonal contraceptive pill is meanwhile used by 100 million women worldwide and even by teenagers whose brains are not yet fully developed the question of how the synthetic steroids contained in hormonal contraceptives act on the brain is to be studied hand in hand with naturally occurring sex differences. This topic summarizes the current state of the art in sex difference research and gives new perspectives in terms of hypothesis generation and methodology. Both are necessary to gain a complete picture of what it is that makes a brain male or female and move towards a neuroscience of sex differences.

Bridging Gaps Between Sex and Gender in Neurosciences

Annie Duchesne, Meng-Chuan Lai, Gillian Einstein, Belinda Pletzer, Marina A. Pavlova, 2020-07-14 *Gender Differences in Mathematics* Ann M. Gallagher, James C. Kaufman, 2004-12-27 Females consistently score lower than males on standardized tests of mathematics yet no such differences exist in the classroom These differences are not trivial nor are they insignificant Test scores help determine entrance to college and graduate school and therefore by extension a person's job and future success If females receive lower test scores then they also receive fewer opportunities Why does this discrepancy exist This book presents a series of papers that address these issues by integrating the latest research findings and theories Authors such as Diane Halpern Jacquelynne Eccles Beth Casey Ronald Nuttal James Byrnes and Frank Pajares tackle these questions from a variety of perspectives Many different branches of psychology are represented including cognitive social personality self oriented and psychobiological The editors then present an integrative chapter that discusses the ideas presented and other areas that the field should explore *Language, Gender, and Sex in Comparative Perspective* Susan U.

Philips, 1987-06-26 Most studies of gender differences in language use have been undertaken from exclusively either a sociocultural or a biological perspective By contrast this innovative volume places the analysis of language and gender in the context of a biocultural framework examining both cultural and biological sources of gender differences in language as well as the interaction between them The first two parts of the volume on cultural variation in gender differentiated language use comparing Western English speaking societies with societies elsewhere in the world The essays are distinguished by an emphasis on the syntax rather than style or strategy of gender differentiated forms of discourse but also often carry out the same forms differently through different choices of language form These gender differences are shown to be socially organized although the essays in Part I also raise the possibility that some cross cultural similarities in the ways males and females differentially use language may be related to sex based differences in physical and emotional makeup Part III examines the relationship between language and the brain and shows that although there are differences between the ways males and females process language in the brain these do not yield any differences in linguistic competence or language use Taken as a whole the essays reveal a great diversity in the cultural construction of gender through language and explicitly show that while there is some evidence of the influence of biologically based sex differences on the language of women and men the influence of culture is far greater and gender differences in language use are better accounted for in terms of culture than in terms of biology The collection will appeal widely to anthropologists psychologists linguists and other concerned with the understanding of gender roles **Intelligence and Cognition: Contemporary Frames of Reference**
